ECONOMIC IMPACTS OF CASINO GAMBLING ON RURAL MICHIGAN COMMUNITIES

Mark Steven Reece, Ph.D. Western Michigan University, 2007

When considering future casino development, it is important to know whether the magnitude of a casino's economic impact.

A way to understand the impact of adding a casino to a rural Michigan community is to study the economic changes during the 6 years surrounding casino's opening. If significant changes occur in population, employment, and commercial, industrial, and residential property values, it may be possible to attribute this change to the introduction of a casino.

Township level data is used for an index of annual percentage change, preceding and following an opening. This study tests for movement in the community's economics for 17 casinos.

The research found a consistent change is not observed. If community public administrators and leaders are offered a casino, they will need to evaluate the proposal carefully. The often-forecasted economic benefit for communities seems to occur about half the time.

ACKNOWLEDGMENTS

Matthew, Christopher, and Nicholas

Many people refer to the peaks and valleys of dissertation work, but fewer live beside the daily rigors silently as the project protracts over years. This effort too brought distress and absence on its course. My sons have experienced it all with curiosity, wonder, and occasional trepidation. Subsequently, each has embarked on their own academic pursuits. They are managing their own academic pursuits and have surpassed milestones and performances far exceeding mine. As their journeys unfold, I pray this effort and their memory of it will remain a strong beacon to reaching their own academic goals with more expediency and success.

Dr. Dale K. Howe

Each acknowledgement is not complete without honoring one key person who holds the lynchpin to successful completion. A person whose talent shepherds the effort. When the student is a public practitioner, the role requires special skills. The position requires a drill instructor presence and a big stick to keep the momentum going. Dr. Howe provided that assistance, a colleague who

ii

Acknowledgments--continued

knew how to strike judiciously with surgical intent to ensure, forward motion.

Dr. Robert Peters Dr. Matthew Mingus Dr. Jeffrey Greene

The committee provided invaluable gifts of instruction, guidance, and support to reach this conclusion. Dr. Peters stepped in to lead this effort when many could not. Dr. Mingus produced a continuous stream of new ideas, methodologies, and evolving practices to push through the fog to make the project march. Dr. Greene, creative evaluator was on point to express the practical perspective to transform it into a readable academic work.

My sincere gratitude to all.

CHAPTER I

INTRODUCTION

Statement of the Problem

It is important for communities considering future casino development to know whether the magnitude of the casino development effects of in other economic communities has had а positive economic impact. Proponents argue that gaming provides a viable means of financial and economic support for communities as they transition away from industrialized income to serviceindustry employment opportunities. Opponents argue gaming brings costs. The factors under investigation here are a measure of economic changes within Michigan communities where casino sites have been located.

They also argue that negative social costs in terms of addictions and financial failures associated with gambling are more than offset by the economic good produced by the casino. Determining the existence of that economic good is difficult because apparent benefits are masked by balance of trade between communities, the impact of substitution, and confusion as to the position of the viewer. In addition, the definition of economic good varies among state government officials, local

government officials, the local citizens, and the owners of the casino.

In Michigan, all casino activity outside the Detroit metropolitan area is operated under Indian tribal authority. As such, the casinos in this study are operated by independent sovereign nations whose existence is, to a degree, outside the United States. This business activity is not only a balance of trade between communities, but it also can be thought of as a balance of trade between nations.

Although it is impossible to prove that economic changes were the result of a casino, the best way to understand the impact of adding a casino to a rural Michigan community is to study the economic changes in that community during the period surrounding the opening of a casino. If significant changes occurred, they may be attributed to the introduction of casino gambling.

In this study, I will test for changes in the communities' economic status for the three years preceding and succeeding 17 casino openings. All casino operations in the state of Michigan, outside the Detroit metropolitan area, were included. Through this research, Τ will identify which economic factors showed the greatest change. The quantitative results will provide evidence to support or refute concerns regarding development of casino sites in Michigan communities.

Addressing these factors will lead to the development of more informed decisions on which to base future casino development decisions.

Comparable Economic Research

Given the increasing presence of gaming, it is important to identify the extent to which casinos are affecting community economic development. Gaming is marketed as an engine for new economic activity (Goodman, 1994; Eadington, 1993; Thompson, 2000). The assessment of this activity-positive, negative, or neutral -is the focus of this research.

Three perspectives are utilized to make this economic assessment. The first is to establish a timing window, short or long term, upon which to observe economic activity. The second option is to consider the its economic source and influence core upon its surrounding area, be it local, regional, statewide, or national. (In this study, a local view is taken because the rural nature of the casino sites within the of state.) This perspective is used to measure the economic factors generated by the inputs and outputs of the casino engine. The third perspective to consider is whether the introduction of a casino into one of Michigan's rural areas has an impact on the economic activity found in the

surrounding community. Economic activity may be evaluated through publicly available data on several variables: employment, number of businesses, business revenue, recreational and non-recreational industry activities, per capita income, household income, property values. These variables are culled from the available economic literature regarding economic characteristics of а community environment (Berquist, 1995). With respect to identifying variables Murphey (1997) cautions against confusing economic activity and economic well-being factors without establishing a definitive construction of specific economic factors used in a study. This inquiry only analyzes economic activity. These aforementioned elements will be of interest to politicians, public administrators, government leaders, and community leaders who have relied on incomplete research using less-defined economic factors to support a position on gaming impacts.

The parsimonious nature of this inquiry provides a mechanism for studying economic impacts on small, rural casino operations. This study examines the economic impacts of legalized gaming upon 17 rural Michigan communities where there has been a transition from nongaming to gaming environments. Although studies that measure the economic impact of casinos on communities do exist, a more complex analysis of this effort could be undertaken using computer modeling techniques like Impact

Analysis for Planning (IMPLAN), Regional Input/Output Modeling System (RIMS-II), or Regional Economic Modeling, Inc. (REMI) as used in other research efforts. However, the rural and sometimes remote locations of the casino sites in this study do not lend themselves to these larger regional modeling designs.

Research Question

Does the introduction of a casino into Michigan's communities have an impact on the economic activity of the surrounding community? Economic activity will be evaluated through publicly available data on the previously listed variables.

Importance in Public Administration

Seventeen rural Michigan communities have experienced an introduction and subsequent growth of casino gaming since 1980. Indian tribes introduced gaming to the state of Michigan as a means of creating a revenue source to benefit their membership. This was followed in 1996 by a citizen's electoral initiative in Detroit that enabled legislation for commercial casinos within the city.

Casino gaming developments are marketed as engines for new economic activity. Proponents are argue that

Reproduced with permission of the copyright owner. Further reproduction prohibited without permission.

benefits follow the introduction of gaming to an area. study will develop important information This for community planners, legislators, and government regulatory agency members to consider when a new casino is proposed. These groups of decision makers will have access to this quantitative scientific research, which will help them make educated decisions about casino development in their communities. It will add to the body of knowledge of economic factors associated with casino operations. This research will also formulate a means for other states to adopt as a basis for future casino decisions.

This research contributes to the existing literature and informs scholars with regards to measurable data associated with the economic activity of a community. Quantitative assessment of this activity will look for positive, neutral, or negative effect in the focus factors for this study.

Chapter II begins with a brief historical perspective of Indian casino development to set the stage for how casino gaming first appeared on the Michigan landscape. The discussion summarizes the legal process upon which casino gaming authorization was obtained. The legal establishment of gaming in Michigan is followed by a discussion of economic theories relating to the impact of gaming. The chapter will close with a discussion of б

the economic factors identified as variables for this research and considered important measures of economic activity for these Michigan communities.

Chapter III provides а graphic and textual description of the methodology of the research around the hypothesis established for this study. An in-depth discussion of the construction of a statistical area will be provided for the data collection effort. The chapter will define a Casino Statistical Area (CSA), provide a description of the data analysis process and establish a time frame through which the study will analyze the impact of casino development on rural Michigan communities.

Chapter IV will present the data, its analysis, and the results for this inquiry. Chapter V will continue to discuss the conclusions derived from the analysis. The discussion will provide an outline to guide public policy development for communities with casinos and the economic factors generated from the casino economic activity for these areas.

CHAPTER II

LITERATURE REVIEW

Historical Perspective

Legal Perspective: Federal and State

Gaming activities in Michigan are predominantly operated as Indian enterprises. Initially opened on independently sovereign lands within the state, seven original tribes were authorized by the U.S. Bureau of Indian Affairs to establish casino gaming operations on their tribal lands in 1993 (National Indian Gaming Commission, 2004).

Currently, 17 casinos are Indian owned while three are commercial and located within the City of Detroit. additional There are two Indian tribes who are negotiating casino development with the state (Michigan Gaming Control Board, 2005). Over the past 26 years, Michigan has transitioned from a non-gaming environment collection of individualized gaming to а sites distributed across the state.

Legalization

Casino impacts-economic and social-on the state of Michigan became the impetus for developing operational

agreements under established federal quidelines. Tribal-State Gaming Compacts (See Appendix B) were negotiated in 1993. Under the compacts, the tribes were given exclusive rights to operate casinos while compensating state and local governments. Should the state permit commercial gaming, the tribes were authorized to cease payment of 8% of their adjusted gross receipts to the state. A 2% tax municipalities local regardless of future qoes to commercial licensing. In comparison, casino industry tax throughout the nation ranges from 6.25 to 20% of adjusted gross receipts (Michigan Gaming Control Board, 2004).

Michigan Casinos

First introduced in 1980, Michigan casino development has a relatively short growth history. Excluding the Detroit area, where casinos were first introduced 1996, casino in sites appear in six communities in the lower peninsula. The city of Mt. Pleasant has two casino sites in the same community. The 11 remaining casinos are distributed across the upper peninsula. They appear north of Mt. Pleasant, which is near the geographical center of the lower portion of the state (See Figure 3).

The rural nature and relative isolation of the casino sites are due in part to their historical Indian origin. Most are located near the shoreline communities

of the state, such as Brimley, Suttons Bay, and Baraga, Michigan.

Figure 1. Willingness to Drive (WTD30) for Michigan Counties

Economic Considerations

Geographical Influence

The rural nature of the state of Michigan and the spatial distribution of the casinos under study provide an opportunity to isolate and attribute economic change to a specific casino site.

It would be impossible to isolate an individual casino's economic activity from the metropolitan economic noise that is generated within a metropolitan region, thus its exclusion here.

Scope and scale play substantial roles in considering economic impacts from casino development. The examiner's position determines whether an effect is in play for a defined study area. In assessing economic impact, it is important to first determine where one will stand in the environment before making these observations. Geographical boundaries determine focus. In establishing a point of observation a researcher needs to look at currency flow, the most visible product of casino operations. Spending activity manifests as economic change, whether it be positive or negative. No change can also be an observation. To ensure that the view is not clouded, a discussion of effects impacting the direct flow of currency needs to be addressed before proceeding. It is necessary to understand the following standard core

concepts to determine whether the effect and magnitude of a factor under study can be attributable to a specific cause.

Substitution Effect

Substitution effect refers to the diversion of money formerly spent on something else. As the price of goods or service increases, people are likely to purchase substitute products instead. Substitutes are goods or services expenditures that are similar, such as fishing versus wagering purchases. The net result is that an economic event that appears to generate one dollar in direct economic output may actually generate less than one new dollar in net direct economic output within the economy sector in focus. The effect is more evident in leisure activities as they are driven by the available recreation time of the purchaser. In the case of casinos, money spent toward other forms of recreation could be diverted to wagering at the casino.

A, hunting excursion in the upper peninsula under substitution may be repackaged and spent in gaming activities at an upper peninsula casino. When considering Michigan as the geographic community scope, this would be substitution. If the boundary scope changed to money spent in the upper peninsula to now spent in the lower peninsula under the same circumstances, it would be a loss to the upper peninsula and a gain to the lower peninsula and therefore not substitution.

Economist Adam Rose (1998), in his meta-analysis report to the National Gambling Impact Study Commission (NGISC), found that claims of economic substitution from casino introduction did not influence pre-existing local restaurants or entertainment facilities. He concluded that even a limited casino venue will yield positive economic benefits to the localized economy. Charles Leven, Donald Phares, and Joel Popkin's (1997) research accounted for substitution effect and still concluded that casino gambling in Missouri had a net positive annual impact, as did Anderson, Cotton, and Watkins (2003) in an economic impact study for the City of Grand Rapids, Michigan

The American Gaming Association (1997) concluded that providing new outlets for consumer spending brings in new income regardless of the nature of the product, claiming efforts to satisfy consumer demand generate new spending.

Substitution effect becomes contingent upon what defines the community scope when determining whether the appearance of new money is generated within the community or originated outside a defined geographic community. The alternative spending resulting under substitution could

mask the economic impact of a casino or cause for incorrect conclusion.

Import/Export Effect

The available economic literature on the subject of exports and imports uses the movement of goods and services into or out of a locale to differentiate between goods coming into (imports) and goods going out (exports) as its definition. Imports and exports represent the movement of market and non-market transactions between communities in quantifiable terms.

In the case of a casino, imports are goods and services purchased outside the area. Large increases in imports tend to hurt sales and profits from other enterprises located within the importing area. Exports are considered economic activity generated from the casino as the goods and services (i.e. entertainment or meals) that are consumed within the jurisdiction by those individuals migrating toward the casino.

Exports are those activities generated by the expenditures of service and entertainment providers to areas outside a given locale. Many enterprises are heavily dependent on exports for revenue; government policies that affect exports can have significant impact on profits. Goods and services purchased by local residents may be either simple substitutes or new revenue if the purchase was previously made from outside the area.

The complexity is greatly reduced if we follow the money. Imports are activities that involve money leaving the area. Exports bring money into the area. Substitutions shift expenditures from one product to another-within the same geopolitical boundaries. Gambling involves a good consumed by outsiders and, to a degree, is taken with them when they leave. However, the money flowing into the area and this transaction is best understood as an export. Acknowledging the need for balance, imports are bad, exports are good, and substitutions are economically neutral.

If the economic impact is affected by substitution, the effect becomes dependent upon where the observer is located and what boundaries are set to measure the effect. When substitution is present, no change occurs in a defined local economy under these circumstances. As illustrated in the example about hunting and gambling, expenditures such as money spent on fishing-related products can be spent on slot machines, for example, and no net change occurs in the local area as long as the money originates and remains within the boundaries of the local economy. When import or export effects are present, the money movement is passing through the defined boundary and either remains in or leaves the local
economy. In the case of imports, money has a net positive impact when it comes into the economy and exports have a negative impact when the money remains outside the local economy.

Variable Operationalization

Employment

Evans and Topoleski (2002) used a difference-indifference framework to compare economic outcomes before and after Native American casino openings. They found 26%, that employment increased by employment to population ratios increased 12%, spillover in jobs per adult increased about 5%, and non-Native-American employment increased in the county.

Daniel Felsentstein, Littlepage, & Klacik (1999) studied socio-economic cost factors resulting from gaming activity. They researched cost-benefit analysis of employment creation with regard to casino startups. Using case studies for their study on expected job creation and net gain in the number of jobs, they concluded that gaming development does not provide an economic benefit through more job creation. Using pre- and post- riverboat employment figures (See Appendix B) in riverboat counties, Grinols (1995) found that for every job created

by riverboats, an existing job was lost in nearby markets.

In contradiction, Ross Alexander (2002), speaking specifically to Indian-based large-scale casino developments, forecasts that the potential for several hundred jobs into the community exists and spillover from subsequent additional commercial enterprises could add hundreds more.

The National Indian Gaming Commission (1999) estimated from its data that Indian gambling operations were responsible for the creation of over 100,000 jobs to 1999.

Isabella County, which is host to two Mt. Pleasant casino venues, demonstrated an increase in population of almost 2,000 individuals per five-year increment from an original community of 41,000 to 60,000 following its gaming development period (U.S. Census, 2000).

Number of Businesses

In studying economic costs to the business community in the northeast region of the United States, Grinols (1995) states from his studies of the industry "the money (local residents) wagered from the local economy, and each dollar they spend . . . , can no longer be spent at a store or restaurant. The situation benefits the gambling operation, but works to the detriment of other

kinds of business" (p. 8). In an anecdotal look at the potential success of a gaming establishment and the local economy, Alexander (2002) states that market saturation can potentially hinder both.

Business Revenue

A study was conducted by Blevins and Jensen (1998) of four gold-mining towns in South Dakota and Colorado after the legalization of limited-stakes gambling was approved and found that revenues were differentially distributed between the towns, such that retail businesses were cannibalized.

In a study of revenue sources for Wisconsin Native American casinos, Gazel, Rickman, and Thompson (2000) found that non-casino areas experience a net loss of funds to casino areas and expenditures to other businesses in the casino areas were displaced. Grinols (1995) further presents evidence that pathological and problem gamblers, which only represent four 4% of the adult population, accounted for 52 % of an average casino's revenues. He made comparisons between gambling and alcohol consumption and indicated that 6.7 % of the population consumes 50 % of all alcohol consumed and concluded that "casino expansion comes at the expense of other sectors, whose revenues are diminished . . . " (p. 11).

Robert Goodman (1994), a professor of environmental design, in reports and testimony to the U.S. Gaming Study Commission stated that "instead of bringing new dollars to the local economy, gambling will siphon away consumer dollars from other local businesses" (p. 39). His research addresses costs from a social observation of historical gaming in the United States.

Moore (1993), looking at net revenues from the Mille Lacs Band of Ojibwa Indians of Minnesota casino operations, observed monies being used to build homes, roads, a health clinic, and two schools while the tribes unemployment rates dropped from approximately 60% to near zero.

Przybylski and Littlepage (1997) analyzed gaming in Chicago, Illinois and contend that the industry infuses a lot of money into local economies, spurs growth and development, provides jobs, and offers more entertainment options.

The U.S. General Accounting Office (2000) has reported revenue assessment statistics generated from convenience and drop-in gaming opportunities.

Recreational Industry Activity

Nickerson (1995) using newspaper content-analysis of tourism and gambling articles from Deadwood, South Dakota, tracked economics, regulatory concerns, initial

questions, logistics and planning, as well as negatives in gaming and concluded that the trends showed gaming to be vital player in tourism and economic growth for the community. He also cited numerous negative social issues after a casino opening in a small community.

Non-Recreational Industry Activity

Goodman (1995) points out that states and communities have to increasingly rely upon their own citizens to increase revenues. Rather than bringing localized "convenience" gambling dollars in, simply drains the local consumer spending from local movie theaters, bowling alleys, restaurants, and retail stores and cannibalizes the local economy. He compares the number of independently owned restaurants in Atlantic City, New Jersey before casinos were legalized -- stating the number dropped from 243 to 146 ten years later. He went on to explain that other businesses outside the casino district experienced a similar decline.

Per Capita Income

Cornell, Kalt, Krepps, & Taylor (1998), contributing to the National Gambling Impact Study, reported the great improvements gaming had on employment, welfare reduction, and personal income rising above historic poverty and federal welfare subsidies.

The U. S. General Accounting Office (2000) reported to House Representative Frank Wolf on the economic effects of gambling with regard to employment, bankruptcy, tax revenues, and community investment from a study of Atlantic City and Atlantic County in New Jersey. Using figures from other published reports, the office was unable to establish a link between bankruptcy and gambling.

Household Income

Few studies are found that provide a quantitative demographic profile or household income of a gambler. Phares (2001) conducted a case study of gaming's net contribution to output, income, and employment in 10 regional economies in the state of Missouri. The study developed an economic demographic for a typical casino patron in the state as a non-addictive gamer with a median age of 37, median family income over \$50,000 per year. Most all non-addictive gamers have high school diplomas and some college education. Over 50% of nonaddictive gamers are female and budget \$50 or less to spend per casino visit. This study did not explain how many individuals fit into this descriptive category, nor did it produce a quantifiable distribution of income.

Property Values

Eadington (1993) gives argument to "higher purposes" when using gambling revenues such as (p. 14) tax benefits, investment stimuli, job creation, regional redevelopment, economic development or and revenue enhancement as factors to observe in determining economic factors. Tiebout (1975) identifies economic factors in regional terms of business investment and residential construction volume.

Research involving the isolation of economic factors have been defined as outgrowth from developing enterprises whereas Schumpeter (1993) described them as a new good not yet familiar or of new quality, a new method of production, the opening of a new market regardless of it appearance before, a new source of supply of raw materials or incomplete goods existing or pending creations, or expansion into an industry as a monopoly or the divestiture from an monopoly.

Variables Used for this Study

The complexity and volume of the data makes it impossible to evaluate all of the possible variables. After careful consideration, the variables chosen were population, employment (labor force), employment (- share of population employed), state equalized value

(commercial), state equalized value(Residential), and state equalized value (commercial/industrial/residential combined). These were chosen primarily based on their importance to public administrators.

Population

are consistent Population measures through the literature as people generally given a choice move and establish residency in areas of economic growth unless limited by domestic circumstances. Kleine, Kloha, & Weisswert (2002) uses total population and percent qrowth one observable variable in population as determining the fiscal health of Michigan communities.

Employment

Taylor (2005) looked at decline in unemployment and decline in income from unemployment insurance as а measure of impact in the proposed Gun Lake Band of Potawatomi Indians casino effort for Wayland, Michigan. Sylvester (1992) cited the creation of 6,000 jobs in New London County, Connecticut as a economic outcome of establishing the Mashantucket Pequot Indian Tribe casino in Ledyard, Connecticut and full employment in Mille Lacs County, Connecticut realized with the Grand Casino of Mille Lacs were the jobless rate prior to the casino opening was as high as 45%. Adams (2004) recommends viewing the removal of unemployed or welfare individuals

from the transfer roles as an assessment measure of regional economic <u>impacts</u> from casinos.

Employment as Share of Population

Murphey (1997) discusses the use of the employment and unemployment rate in measuring economic well being. He questions the adequacy of conventional measures of unemployment in economic statistics as representative favoring the percentage employed. Jobs created from casino operations were cited by Kettl (2003) in study of California Indian operated casinos employment was estimated at 41,000 workers, of which only 10& were Indian. In a study of Florida casino operations, Perlman (1998) cited ``jobs are the greatest gift the Indian Gaming Regulatory Act gave to tribes'' (p. 4).

Commercial Property

Alan GreenBlatt (2003) used the Salt River Pima-Maricopa Indian community, who contributed millions to gene research in Phoenix, Arizona to satisfy an operating compact requirement to assist with local economic development, as an example to illustrate the support both community and tribe itself where a high incidence of diabetes existed. Rose (1998) assessed casino literature and recommended impact measurement variables of facility construction as appropriate: taxes paid on facility construction, property values on desirable property, property tax revenues, and long-term investment in education, infrastructure, and redevelopment. Fulton (2006) also cites commercial assets and broad-based capital commercial development as useful in assessing casino operations.

Residential Property

Anderson (1997) studied three casino community sites for the American Gaming Association and used residential construction and housing market as economic impacts measurements.

Commercial/Industrial/Residential Property

Kleine, et. al. (2002) developed a 10- point scale to measure fiscal distress of Michigan communities citing total revenues, real taxable value, and general fund growth in townships for assessment purposes. Anderson's (2003) environmental impact study of the Gun Lake Band of Potawatomi Indians casino proposal for Gun Lake, Michigan recommends an input/output analysis for economic impact in new industrial activity, expenditures, and external visitors.

CHAPTER III

METHODOLOGY

Cognitive Model

The cognitive model is straight forward. Various economic variables make up an economic profile. When an

Figure 2. Cognitive Model

event occurs, its potential impact is evaluated based on a comparison of the economic profile before and after the event.

Hypothesis

Research Hypothesis

The introduction of a casino into Michigan's rural areas has an impact on the economic activity of the surrounding community.

Economic activity is evaluated through three variables: population, employment, and property values representing economic characteristics of a community environment.

Research Model

This study uses an interrupted time-series view of factors associated with economic activity subject to change within an area defined by a casino site at its core.

All the quantitative economic data collected will be extracted from public domain information sources. No individual subjects can be identified. There is no risk to private individuals from the secondary data sources used in this project. The research involves data, documents, and records that have been collected in the 1980, 1990, and 2000 Census and published to the public.

Community Design

This research studies communities using a CSA. The design for the community is generated from the same structure developed by the U.S. Census Bureau's standards description for Metropolitan and Micropolitan Statistical Areas (MSAs). Using the casino's physical structure at its core, the CSA is similar in structure to the county formulation used in MSAs where the core statistical county comprises a population of 50,000 or more of the available population. The MSA construct was considered due to its consistent geographical integrity, standardized units, and use of existing geo-political The parallel construction of boundaries. а casino statistical area has as its core the township unit of government, whereas the federal definition uses a county as its core governmental statistical unit for developing the statistical area. The smaller township unit provides data consistency over the entire state. The use of township statistics more closely reflects the geographical structure impacted by a casino over a larger county boundary definition. The county MSA boundary definitions would allow economic activity to be skewed to one corner of the defined area, whereas a CSA by this

definition places the economic engine at its center. After having calculated the median range of drive distance using a standard radius of 15 miles, this distance encompasses approximately the same area as would be encountered within an average single Michigan county or approximately 700 square miles.

In addition, using a willingness to drive (WTD) calculation as an adjusted radius across the state addresses any possible variance in radius of the immediate economic impact of a casino. The proposed statistical area definition from the Census Bureau construct requires further discussion as to the similarities and logic of the CSA construct. Further parallel details and comparisons are described in Table 1 Comparison Definition of Casino Statistical Area.

Table 1

Metropolitan Statistical Area vs. Casino Statistical Area

	Metropolitan Statistical Area (MSA)	Casino Statistical Area (CSA)	
Core Base	Core county with a population of 50,000 or more	Casino Structure	
Geographical Boundaries	County Units	Township Units	
Employment Interchange Measure (EIM)	Sum of the percentage of commuting from smaller to core	Standard radius or adjusted radius (relative WTD) from casino structure	
Aggregations	25 percent or more of the commuting population into the core area	Inclusion of at least 50 percent of the land area within defined radius	

Metropolitan Statistical Area

The MSAs have been in use for approximately 50 years define standard statistical areas to to develop comparable data products. It was created to satisfy the need for a single set of geographic standards around centers of population and activity. Together, they are used to define a recognized population nucleus and identify adjacent communities that have a high degree of integration. They provide nationally consistent definitions for collecting, tabulating, and publishing federal statistics for a set of geographic areas and have been successful in statistically representing social and and outlying economic linkages between urban cores integrated areas. The standards defining the MSA are publicly reviewed and subsequently adopted in conjunction with the decennial census, most recently published on structure 22, 2000. Their Auqust and standards, availability, stable boundaries, and familiar geographic entities were modeled in this study application (OMB, 2000).

Casino Statistical Area

The logic used to construct the CSA definition is based upon the intended scale of focus used in this study. Casino employees and staff venture from the casino location to and from home or to other enterprises where

their compensation is distributed into the area. Due to small size of the casinos, constructing an area where the probability of measurable economic influence could be expected would eliminate а national or standard perspective. A measure of the economic impact of a single casino operation within these larger boundaries would not be attainable. Other factors and mechanisms of economic output could not be isolated at these levels from the activity generated from one casino. The county level unit analysis of statistical data has a lesser degree of masking impact with regard to specific economic indicators by scale. Creating a customized statistical area for study based on township data aggregation allows use of standard census data while reducing the area included to a small enough territory that both economic impact and source are more definitively measurable. These CSAs can be designed using criteria similar to those used for U.S. Census Bureau MSAs.

Incorporation of the median drive distance and commuting time factors allows for constructing boundaries from which realistic comparisons may be made. Distance from a casino structure scribed by a circle of given radius can approximate the size of a county in area but may not provide defensible consistency when considering all the impacted area inclusive to the county. The CSA level of analysis compensates for this shortfall due to

its smaller, more consistent structure. The CSA radius can also be adjusted to incorporate a relative WTD that may vary considerably from one area of the state to another.

Factors for relative WTD and standard economic measures are derived from U.S. Census Bureau data regarding drive time to work. The assumption here is based upon the logic that how far a person is willing to drive to work is an indicator of how far an individual is willing to drive for recreation, which is gambling in this case.

Development of the WTD ratio is based upon the ratio between the percentage of the local population and the percentage of the Michigan population as a whole who drive 30 or more minutes to work. Across the state, the percentage of a local county workforce willing to drive 30 or more minutes to work varies considerably. The minimum is 11.3% and the maximum is 51.5%. Figure 2 shows this with shades of gray. The lightest shades indicate shortest commute times and the darkest shades the indicate the longest commute times. Appendix T provides this data in detail.

Figure 3. Willingness to Drive 30 or More Minutes to Work (Darker shades indicate shorter commutes)

Figure 3 shows Michigan counties with their WTD as shades of gray and the approximate locations of the casinos being studied. (Casinos are indicated by number according to the standardized reference numbers used in all tables.)

Figure 4. Willingness to Drive (WTD30) for Michigan Counties

Willingness to Drive

Finite distance will be calculated as a given radius from a casino site as center. The circumscribed areas under study are drawn from an analysis and computation of statewide relative WTD data available in the standard economic measures of activity available from the U.S.

Census. This adjusted radius is to be determined and is anticipated to approximate the base radius of a county.

The state-wide average indicates 31 % of the population will drive 30 minutes to work, which leaves 69% of the state population driving less than 30 minutes to work. The WTD ratio multiplied by the base CSA radius of 15 miles yields the local CSA radius in miles (See Formula xxx).

% of Local Workforce <u>Willing to Drive >= 30 Minutes to Work</u> % of Michigan Workforce Willing to Drive >= 30 Minutes to Work

Willingness to Drive Ratio x Base 15 Mile CSA Radius = Local CSA Radius

Figure 5. Willingness to Drive Ratio

For this inquiry calculations will be performed using the average radius established for a county (15 miles) and the radius developed based upon the local adjustment to WTD30. It may be that the conclusions drawn from analysis of the two sets of data differ.

A detail of the calculations and radii can be viewed in Table 2, Michigan Casinos and Figure 1, Willingness to Drive (WTD30) for Michigan Casinos.

Table 2

Michigan Casinos

	Casino Name	County	WTD30 Radius
	Bay Mills Resort and Casino, Brimley, MI	Chippewa	17.8
2	Leelanau Sands Casino, Suttons Bay, MI Leelanau		15.8
3	Kewadin Vegas Casino, Sault Ste. Marie, MI	Mackinac	16.1
4	Ojibwa Casino, Baraga, MI	Baraga	18.3
5	Saginaw Chips Card Room & Casino	Isabella	18.0
6	Lac Vieux Desert Casino, Watersmeet, MI	Gogebic	18.3
7	Kewadin Shores Casino, St. Ignace, MI	Mackinac	16.1
8	Brimley Kings Club Casino, Brimley, MI	Chippewa	17.8
9	Chip-In Island resort and Casino, Harris, MI	Menominee	17.3
10	Kewadin Slots, Christmas, MI	Alger	16.8
11	Kewadin Slots, Hessel, MI Mackinac		16.1
12	Kewadin Slots, Manistique, MI	Schoolcraft	17.9
13	Ojibwa Casino, Marquette, MI	Marquette	17.9
14	Turtle Creek Casino, Williamsburg, MI	Grand Traverse	17.7
15	Soaring Eagle Casino, Mt. Pleasant, MI	Isabella	18.0
16	Little River Casino, Manistee, MI	Manistee	16.7
17	Victories Casino, Petoskey, MI	Emmet	17.7

Figure 6. Willingness to Drive (WTD30) for Michigan Casinos

Methodology for Data Analysis

The township level of data collection is used because the relative small size of the core casino engine and because the township statistics is where the data exists.

Data obtained for the CSA will be obtained at the township level where greater than 50% of the land area is inclusive in the radius of the CSA.

Identifying the opening date for every casino under study was problematic. Some of the casinos were operating in limited capacity prior to official recognition and others were open to restricted membership prior to formal operations. Still others did not record opening information. To identify an opening event for all casinos under study, the known year and month are used. Exact dates for casino openings in Michigan were impossible to determine. This problem was encountered by another researcher studying the same Michigan sites (Berquist, 1995). A listing of opening dates for the Michigan casino under study can be seen in Table 2, Michigan Casinos. For consistency, casino sites are listed by number (1-17) in the approximate order they opened.

Table 3

Michigan Casinos

	Open	Casino Name	County
1	Jul-84	Bay Mills Casino, Brimley, MI	Grand Traverse
2	Sep-85	Leelanau Sands Casino, Suttons Bay, MI	Leelanau
3	Nov-85	Kewadin Vegas Casino, Sault Ste. Marie, MI	Mackinac
4	Nov-85	Ojibwa Casino, Baraga, MI	Baraga
5	Aug-87	Saginaw Chips Casino	Isabella
6	Jan-88	Lac Vieux Desert Casino, Watersmeet, MI	Gogebic
7	May-88	Kewadin Shores Casino, St. Ignace, MI	Mackinac
8	Jul-89	Brimley Kings Club Casino, Brimley, MI	Chippewa
9	Jul-91	Chip-In Island Casino, Harris, MI	Menominee
10	Jul-94	Kewadin Slots, Christmas, MI	Alger
11	Jul-94	Kewadin Slots, Hessel, MI	Mackinac
12	Jul-94	Kewadin Slots, Manistique, Ml	Schoolcraft
13	Sep-94	Ojibwa Casino, Marquette, MI	Marquette
14	Jun-96	Turtle Creek Casino, Williamsburg, MI	Grand Traverse
15	Dec-96	Soaring Eagle Casino, Mt. Pleasant, MI	Isabella
16	Jul-99	Little River Casino, Manistee, MI	Manistee
17	Jul-99	Victories Casino, Petoskey, Ml	Emmet

An interruption event during the observation window therefore is anticipated to have a pre-opening escalating activity and a gaining of momentum output after the proximate opening date established by month and year. To identify this for analysis the period two months prior and two months after the established month and year of opening is used as the event window. A diagram positioning casino opening dates can be seen in Figure 2, Approximate Casino Opening Sequence and Year.

Figure 7. Approximate Casino Opening Sequence and Year

Decennial census data along with mid-decade bureau data reports obtained from year-to-year and month-tomonth increments will be used to establish the economic trend line.

Raw data was posted, organized, and displayed using Microsoft Excel software. Once structured and subjected to preliminary descriptive analysis the data import into Statistical Package for Social Science (SPSS) for a higher level of analysis and comparisons for evidence of change across the trend line. Final analysis conducted change across the trend line. Final analysis conducted using the modeling Decision Time software to test the strength of observed economic activity over the time window.

Time Series

Time series is one of the oldest analysis activities of scientific human history. Growth models exist in biology, physical science, and the social sciences. This study will use a basic point scope formula to identify the trend line of economic activity associated with a casino event. The algebraic formula of the regression model for a trend line is represented by the following equation:

Formula #1

Y = ax + b

In the equation ``Y'' is the dependent
``a'' is the coefficient
``x'' is the is the independent variable
``b'' is the Y-axis intercept

To develop an equation to reflect the linear regression that will describe every incident in this inquiry, the equation is more appropriately described below:

Formula #2

$$\mathbf{Y} = \mathbf{+}\mathbf{a}_1\mathbf{x}^1 + \mathbf{b}_0$$

In the equation ``Y'' is the dependent
``a₁'' is the
``x'' is the is the independent variable
``b₀'' is the Y-axis intercept

Interrupted Time Series

Most of the models in this inquiry are based on an interrupted time series. This is simply a matter of looking at an existing trend and how it changes after some event has occurred. In this case the event being considered is the opening of a casino.

While it is not possible to prove an event is the cause of a change in the trend, it is possible to show a degree of correspondence between the event and the change in the trend. Part of the challenge is the fact that most economic data is only available once a year or in some cases once every two years. This makes it more difficult to prove an event exactly fits with the timing of a change in the established economic pattern.

There is also a problem with the scale of the data. Because all of the casinos being studied are in rural areas, most of the economic data involves relatively small values. Small values can be quite noticeably shifted by any number of forces. This makes changes in a trend difficult to distinguish from background noise. It is also possible to have a downward trend prior to the event being studied that changes to a flat pattern after the event. If an event neutralizes a downward trend, it is a positive change for the community but may appear to be of little significance. For this reason, this inquiry looks at the change in the pattern after an event, offset by the changes already taking place prior to the event.

CHAPTER IV

ECONOMIC FACTORS

Research Data

The data used for this study is all publicly However, finding it is not simple. Most available. economic data is only available at the county level, and this ideal for studies of rural casinos. The not businesses are too small to have a provable economic impact on a multi-county area. Geographically, they may be located near a county line and the economic impact cannot the readily assessed from studying one county. The best data available is at a township level and requires a great deal of sorting and aggregation before it can be applied to the problem.

An example of the challenges is the availability of the simple township population data. It is possible to obtain data from the U.S. Census Bureau at a township level for each year after 1990. However, the government has not made that level of data available for earlier years. The Michigan State Demographer's Office had earlier data, but it was spread across two different reports and only available in paper format. It is a huge undertaking to sort out data on 1,242 Michigan townships

from two different lists that do not use the same naming conventions for each area. This is not impossible, but it is very significant that prospective references to the economic impact of new casinos are probably not based on actual demographic data.

It is significant to an understanding of the issue to know how much of the data that is apparently referenced by both proponents and opponents is simply not available.

Economic Factors

Population

Population is a very basic indicator of a community's economic well-being. Detail on this factor is available but not in a format that makes analysis simple. Even the State of Michigan only had this data available as paper copies of previously tabulated data. Population data is readily available. Population data at a township level and suitable for use in a time-series analysis was not available.

Employment - Unemployment Percentage

Unemployment is probably the most common and perhaps the least useful measure of employment. To a job seeker, the percentage of unemployment may be an indicator of his or her chances of finding a job. To a public

administrator, it omits critical detail. A public administrator is more interested in the balance between the number of citizens to be supported and the number contributing, through taxes, to the support.

Employment - Labor Force

One way to look at employment is simply to examine the size of the available labor force. This is the total of those employed and those known to be unemployed. There are always those who would wish to work but are no longer shown on the unemployment roles and cannot be counted. Even though labor force is an incomplete number, it is still a powerful indicator of local economic health.

Employment - Share of Population Employed

An alternate way to look at unemployment is employment. How many people are working? Typical unemployment figures leave out too much by focusing only on those individuals known to be looking for work. A better indicator of community economic well-being is the share of the population employed. Those employed pay taxes and spend money. If every other indictor held constant and more of the population is working, the community's economic well-being has improved.

Number of Businesses

This data was found to be unavailable at the township level required for this inquiry.

Business Revenue

This data was found to be unavailable at the township level required for this inquiry.

Recreational Industry Activity

This data was found to be unavailable at the township level required for this inquiry.

Non-Recreational Industry Activity

This data was found to be unavailable at the township level required for this inquiry.

Per Capita Income

This data was found to be unavailable at the township level and for enough years to be useful for this inquiry.

Household Income

This data was found to be unavailable at the township level for enough years to be practically applied to this inquiry.

Property Values

State Equalized Value (SEV) is one way to track property values. An optimum statistical value would be to use real estate market value. However, that would require selling all the property to determine monetary worth. Tax revenue would work, but there are restrictions on how fast taxes can increase, so tax revenue may not keep up with economic growth. A practical alternative is to use SEV. Three values were used in this study. SEV (commercial), is the value of commercial property for the township, SEV (residential), the value of residential property, and SEV (commercial/industrial/residential).

Commercial SEV represents non-residential real property able to yield a profit or be used for the placement of business activities that support commercial purposes, such as wholesale, retail or service operations.

Industrial SEV represents non-residential real property used for the establishment of industrial manufacturing activities or purposes, such as manufacturing, processing of products, or warehousing.

The last term is the sum of all three values. Industrial is used to rule out a local economic climate that did change and did so because of industrial activity and not because of activity more nearly related to the casino.

Limitations

Defining a baseline in the study populations prior to the introduction of this change was a major challenge in this study.

The entire breadth of Michigan Indian gambling impacts both social and change factors upon Michigan are not within the scope of this study nor is it integral to this research.

Not unlike the impacts related to Roosevelt's New Deal that have a cause and effect relationship upon the impacts visited here, intangibles exist but are not measurable in the current quantitative context. Cultural impacts and effects, for example, are not part of this research.

There may be further data in the gaming environment that this researcher does not have access to at this juncture. The typically Indian ownership of the Michigan casinos studied makes much of record keeping optional and the data that does exist is not publicly most of available. However, there are effective alterative measures of community economic health. If the local economy improves when a casino is introduced, the possibility exists that it did so because the casino was introduced. The results of the economic indicators used for the 17 casinos studied shows no clear pattern of

improved economic health in the communities surrounding new casinos.

It is important to note that two casinos appear to have performed much better than the others. An important topic for future study would be extending this research to determine why these casinos appear to have brought much more prosperity with them.

CHAPTER V

RESEARCH METHODOLOGY

Methodology

Definitions

The research used publicly available survey data imported into the customized data tables for the foundation data. Most of the needed data sets were available from state and federal resources and drawn out to the county and township statistical level.

Some data sets were transferred electronically from publicly archived information at the Michigan Department of Treasury and U.S. Census Bureau. Other datasets only exist in hard copy formats, and that information was hand tabulated into customized data tables using the selected variable framework discovered in the literature review of potential economic factors impacting community economics. The following variables were utilized:

Population

Population data was obtained through across decennial U.S. Census population surveys from 1980 through 2000. Data was captured from short- and long-form
census surveys and the composite American Community Survey (ACS) of demographic, housing, social, and economic information on the existing U.S. populations during these respective counts.

Employment

The reported number of jobs data was obtained from the census data tables for every township identified as part of the focus CSA communities of this study.

Unemployment is defined as the percent of the available labor force potentially seeking employment that is not currently employed. These include all persons who had no employment during the reference week, but were available for work, except for temporary illness, and had made specific efforts to find employment some time during the 4-week period ending with the reference week. Persons who were waiting to be called back to a job from which they had been laid off need not be looking for work to be classified as unemployed.

Property Values

SEV is the assessed value as finalized by the county and state equalization process that equally and uniformly represents 50% of the true cash value of the property in question as adjusted per year.

The classes of real property assessments were selected from three classifications based upon their

52

value in identifying economic factors for analysis of change over time.

Residential SEV represents real property used for residential purposes, such as single-family homes, duplexes, condominiums, and apartments of four units or fewer.

Process Description

The CSA defined geographical boundaries were overlapped with the available township level economic data related to population, income, revenue, and property values from state and federal resources. The township values were extracted from these public sources and imported into tabular format for further development.

The constructed data sets were developed from related economic factors identified as being a significant in the community economics of a CSA.

The analytical data tables were constructed and populated using Microsoft Excel spreadsheets to facilitate further continued analysis using the functions available in this organizational computer application.

Audit and Value Verification

The economic data sets of values were then audited for verification of their field contents. The absence of specific entries in data fields was manually rechecked and corrected. A first iteration using electronic audit functions searched the compiled data for additional missing and abnormal values and cross checked the discovered anomalies with original data sources for verification.

A second iteration using graphic output audit function ran the data for anomalies. Some data-entry errors were found in the data transfer between formats. Some additional errors were tracked back to the source data. Inconsistencies were again cross checked with original data source for verification.

54

CHAPTER VI

DATA ANALYSIS

Summary of Available Data

Data for Population

Population is one indicator of area economic well being. This section of the data analysis examined the difference between CSA population cumulative changes during the three years before and CSA population cumulative changes during the three years after the introduction of a casino into the community. The data demonstrates change between the total of annual changes during the previous three years and the total of annual changes during the following three years.

CSA 01 - Population had a cumulative +8% change after the CSA introduction. An observable change occurred four years after opening, but is difficult to attribute the increase to the CSA introduction.

55

Figure 8. CSA-01, Bay Mills Casino, Grand Traverse, Population Summary

CSA 01 - Population had a cumulative +8% change after the CSA introduction. An observable change occurred four years after opening, but is difficult to attribute the increase to the CSA introduction.

Figure 9. CSA-02, Leelanau Sands Casino, Leelanau, Population Summary

CSA 02 - Population had a cumulative +3% change after the CSA introduction. The rate of change appears to coincide with the casino opening.

Figure 10. CSA-03, Kewadin Vegas Casino, Mackinac, Population Summary

CSA 03 - Population had a cumulative -2% change after the CSA introduction. A significant increase appears approximately one year after the casino opened.

Figure 11. CSA-04, Ojibwa Casino, Baraga, Population Summary

CSA 04 - Population had a cumulative -2% change after the CSA introduction. There is no significant change that can be attributed to the casino.

Figure 12. CSA-05, Saginaw Chips Casino, Isabella, Population Summary

CSA 05 - Population had a cumulative -2% change after the CSA introduction. There is no significant change that can be attributed to the casino opening.

Figure 13. CSA-06, Lac Vieux Desert Casino, Gogebic, Population Summary

CSA 06 - Population had a cumulative +8% change after the CSA introduction. The change appears to coincide with the casino opening, yet overall population numbers are not significant.

Figure 14. CSA-07, Kewadin Shores Casino, Mackinac, Population Summary

CSA 07 -Population had a cumulative +8% change after the CSA introduction. There appears be to а significant change that coincides with the casino opening.

Figure 15. CSA-08, Brimley Kings Casino, Chippewa, Population Summary

CSA 08 - Population had a cumulative +9% change after the CSA introduction. Population change appears to have occurred prior to casino opening and is not attributable to the casino opening.

Figure 16. CSA-09, Chip-In Island Casino, Menominee, Population Summary

CSA 09 - Population had a cumulative +3% change after the CSA introduction. The CSA has a larger population base and does appear to coincide with the casino opening.

Figure 17. CSA-10, Kewadin Slots Casino, Alger, Population Summary

CSA 10 - Population had a cumulative -5% change after the CSA introduction. Growth occurred four years prior to casino opening and involves a small population base.

Figure 18. CSA-11, Kewadin Slots Casino, Mackinac, Population Summary

CSA 11 - Population had a cumulative +1% change after the CSA introduction. Growth occurred four years prior to the casino opening and involves a small population base.

Figure 19. CSA-12, Kewadin Slots Casino, Schoolcraft, Population Summary

CSA 12 - Population did change, yet had no apparent change in growth rate to coincide with the introduction of the casino.

Figure 20. CSA-13, Ojibwa Casino, Marquette, Population Summary

CSA 13 - Population had a cumulative -9% change after the introduction of the casino. The pattern of change does not lead to any definitive conclusions.

Figure 21. CSA-14, Turtle Creek Casino, Grand Traverse, Population Summary

CSA 14 - Population change continued at the same rate after the CSA introduction. This CSA is one of the largest population bases. The change is not clearly attributable to the casino opening.

Figure 22. CSA-15, Soaring Eagle Casino, Isabella, Population Summary

CSA 15 - Population had a cumulative +2% change after the CSA introduction. This CSA is one of the larger population bases and the significant change is consistent with the casino opening.

Figure 23. CSA-16, Little River Casino, Manistee, Population Summary

CSA 16 - Population had a cumulative -6% change after the CSA introduction. The mid-sized CSA and casino opening coincides with the timing of the negative growth.

Figure 24. CSA-17, Victories Casino, Emmet, Population Summary

CSA 17 - Population had a cumulative +13% change after the CSA introduction. This mid-sized CSA has significant change coinciding with the casino opening.

Summary of Population Change Data

the preceding data Analysis of is a two-step process. The observation of change coinciding with the casino opening occurs in only half the cases. This pattern is too weak to make attribution relevant. The population change or change in population growth rate does not occur often enough to make a potential link the introduction of a casino and improved between economic health a valid argument. If a change occurred every time or most of the time, its cause might be traced. The inconsistency of population change during the period associated with opening of a casino means there is logical basis on which to base a link between no population growth and a casino opening.

Data for Employment - Labor Force

Labor force is one component of the overall employment picture for a community. Labor force, as used here, is the total number of people (employed and unemployed) known to be available for work. The true labor force number is larger than the figures listed. It is not possible to count those available for work but not receiving benefits. Therefore, the number used here are individuals known to be looking for work those and receiving either benefits or paid employment.

73

This section of the data analysis will look at the difference between CSA labor force cumulative changes during the three years before and the cumulative changes during the three years after the introduction of a casino into the community. Again, difference in the total of the changes during the previous three years greater than or less than the total of the changes during the following three years is evident.

Figure 25. CSA-01, Bay Mills Casino, Grand Traverse, Labor Force Summary

CSA 01 - Labor force experienced a cumulative -7% change after the initial CSA introduction. The negative change may be deceptive due to the significant growth in labor force one year after the casino opening.

Figure 26. CSA-02, Leelanau Sands Casino, Leelanau, Labor Force Summary

CSA 02 - Labor force experienced a cumulative +14% change after the CSA introduction. This mid-sized CSA showed significant growth.

Figure 27. CSA-03, Kewadin Vegas Casino, Mackinac, Labor Force Summary

CSA 03 - Labor force experienced a cumulative +7% change after the CSA introduction. This small CSA has no clear pattern.

Figure 28. CSA-04, Ojibwa Casino, Baraga, Labor Force Summary

CSA 04 - Labor force experienced a cumulative +5% change after the CSA introduction. This small CSA changed significantly in a positive direction following the casino opening.

Figure 29. CSA-05, Saginaw Chips Casino, Isabella, Labor Force Summary

CSA 05 - Labor force experienced a cumulative +8% change after the CSA introduction. This mid-sized CSA showed positive change following casino opening.

Figure 30. CSA-06, Lac Vieux Desert Casino, Gogebic, Labor Force Summary

CSA 06 - Labor force experienced a cumulative +20% change after the CSA introduction. This is a small CSA, but the change is significant.

Figure 31. CSA-07, Kewadin Shores Casino, Mackinac, Labor Force Summary

CSA 07 - Labor force experienced a cumulative +14% change after the CSA introduction. This small CSA showed significant positive change following casino opening.

Figure 32. CSA-08, Brimley Kings Club Casino, Chippewa, Labor Force Summary

CSA 08 - Labor force experienced a cumulative -8% change after the CSA introduction. This small CSA is without a clear pattern of change.

Figure 33. CSA-09, Chip-In Island Casino, Menominee, Labor Force Summary

CSA 09 - Labor force experienced a cumulative -8% change after the CSA introduction. This mid-sized CSA had the largest change in the year prior to the casino opening.

Figure 34. CSA-10, Kewadin Slots Casino, Alger, Labor Force Summary

CSA 10 - Labor force experienced a cumulative -3% change after the CSA introduction. This small CSA had little apparent change in the rate of growth.

Figure 35. CSA-11, Kewadin Slots Casino, Mackinac, Labor Force Summary

CSA 11 - Labor force experienced a cumulative -10% change after the CSA introduction. This small CSA hard the largest change occur in the year prior to the casino opening.

Figure 36. CSA-12, Kewadin Slots Casino, Schoolcraft, Labor Force Summary

CSA 12 - Labor force experienced a cumulative no change after the CSA introduction. This small CSA had no clear pattern of change.

Figure 37. CSA-13, Ojibwa Casino, Marquette, Labor Force Summary

CSA 13 - Labor force experienced a cumulative -12% change after the CSA introduction. The mid-sized CSA showed significant decrease coinciding with the casino opening.

Figure 38. CSA-14, Turtle Creek Casino, Grand Traverse, Labor Force Summary

CSA 14 - Labor force experienced a cumulative +2% change after the CSA introduction. This large CSA with large labor force had no clear change coinciding with the casino opening.

Figure 39. CSA-15, Soaring Eagle Casino, Isabella, Labor Force Summary

CSA 15 - Labor force experienced a cumulative +8% change after the CSA introduction. This mid-sized CSA had very significant growth coinciding with the casino opening.

Figure 40. CSA-16, Little River Casino, Labor Force Summary

CSA 16 - Labor force experienced a cumulative -2% change after the CSA introduction. This mid-sized CSA did not display a clear pattern of change.

Figure 41. CSA-17, Victories Casino, Emmett, Labor Force Summary

CSA 17 - Labor force experienced a cumulative -8% change after the CSA introduction. This mid-sized CSA had no significant change.

Summary of Labor Force Data

Labor force change coincided with the casino opening in three-quarters of the cases observed. In 11 of the 13 cases, the change occurred in the year prior to the casino opening and may be attributable to incoming construction trades activity or astute business operators in the community. The public administrator could expect revenues to increase, and while not directly attributable to the casino operations, the timing is consistent.

Data for Employment - Percent of Population Employed

is often described Unemployment rate as the percentage of the labor force not currently working. This is appropriate if the audience is a person wishing to understand the job market. If, the audience is a public administration official looking at the economic picture, a more logical metric would be the percentage of the population who are working or unemployed. This population represents the load on local public services. The percentage of people employed then becomes a proxy measure for the revenue stream.

This section of the data analysis will look at the difference between CSA percent of population employed cumulative changes during the three years before and CSA percent of population employed cumulative changes during

92

the three years after the introduction of a casino into the community. Further evidence of total changes during the previous three years greater than or less than the total of the changes during the following three years is present.

Figure 42. CSA-01, Bay Mills Casino, Grand Traverse, Percent of Population Employed Summary

CSA 01 - The percent of population employed had a cumulative -5% change after the CSA introduction. For this CSA, the population increased and the percentage employed decreased. This situation becomes a double negative for the local administrator. There are more citizens needing services and fewer citizens contributing to the coffers.

Figure 43. CSA-02, Leelanau Sands Casino, Leelanau, Percent of Population Employed Summary

CSA 02 - The percent of population employed had a cumulative +16% change after the CSA introduction. This mid-sized CSA had a population increase and the percent employed increased resulting in a double positive revenue picture for the local administrator.

Figure 44. CSA-03, Kewadin Vegas Casino, Mackinac, Percent of Population Employed Summary

CSA 03 - The percent of population employed had a cumulative +23% change after the CSA introduction. This small CSA has an inconsistent pattern.

Figure 45. CSA-04, Ojibwa Casino, Baraga, Percent of Population Employed Summary

CSA 04 - The percent of population employed had a cumulative +19% change after the CSA introduction. This mid-sized CSA saw a population decrease and the percentage employed increased thus increasing the revenue picture.

Figure 46. CSA-05, Saginaw Chips Casino, Isabella, Percent of Population Employed Summary

CSA 05 - The percent of population employed had a cumulative +6% change after the CSA introduction. This large CSA saw population increase and percentage employed increase therefore the revenue picture would be expected to increase.

Figure 47. CSA-06, Lac Vieux Desert Casino, Gogebic, Percent of Population Employed Summary

CSA 06 - The percent of population employed had a cumulative +2% change after the CSA introduction. Here, the small population remained stable while the population employed increased. This is a favorable pattern for a local public administrator. There is the same number of people seeking services, but a larger percentage of them are contributing to the available revenues.

Figure 48. CSA-07, Kewadin Shores Casino, Mackinac, Percent of Population Employed Summary

CSA 07 - The percent of population employed had a cumulative -6% change after the CSA introduction. In this small CSA the population increased slightly while the percent employment decreased. The revenue impact would be roughly neutral.

Figure 49. CSA-08, Brimley Kings Casino, Chippewa, Percent of Population Employed Summary

CSA 08 - The Percent of Population Employed had a cumulative -30% change after the CSA introduction. The small CSA saw population increase and percentage population decrease a double negative that would increase the load on the revenue picture.

Figure 50. CSA-09, Chip-In Island Casino, Menominee, Percent of Population Employed Summary

CSA 09 - The percent of population employed had a cumulative -11% change after the CSA introduction. The mid-sized CSA saw population stay stable while the percentage of population employed decreased, a load inducing impact upon the revenue picture.

Figure 51. CSA-10, Kewadin Slots, Alger, Percent of Population Employed Summary

CSA 10 - The percent of population employed had no cumulative change after the CSA introduction. This small CSA saw both population and percent population employed remain stable with little change.

Figure 52. CSA-11, Kewadin Slots Casino, Mackinac, Percent of Population Employed Summary

CSA 11 - The percent of population employed had a cumulative -9% change after the CSA introduction. This small CSA had stable population growth and a slight decrease in percent population employed. This results in an expected negative impact upon the local area.

Figure 53. CSA-12, Kewadin Slots Casino, Schoolcraft, Percent of Population Employed Summary

CSA 12 - The percent of population employed had a cumulative +2% change after the CSA introduction. This small CSA saw a slight increase in population and percentage employment improving the revenue picture.

Figure 54. CSA-13, Ojibwa Casino, Marquette, Percent of Population Employed Summary

CSA 13 - The percent of population employed had a cumulative -3% change after the CSA introduction. This mid-sized CSA saw population decrease and percentage employment decrease leaving the revenue picture declining.

Figure 55. CSA-14, Turtle Creek Casino, Grand Traverse, Percent of Population Employed Summary

CSA 14 - The percent of population employed had a cumulative +1% change after the CSA introduction. A large CSA with population increasing and percent employment slightly increasing the revenue picture is better with a casino.

Figure 56. CSA-15, Soaring Eagle Casino, Isabella, Percent of Population Employed Summary

CSA 15 - The percent of population employed had a cumulative +4% change after the CSA introduction. This large CSA had slight increases in population and percentage employment improving the revenue picture.

Figure 57. CSA-16, Little River Casino, Manistee, Percent of Population Employed Summary

CSA 16 - The percent of population employed had a cumulative -4% change after the CSA introduction. This mid-sized CSA had population decrease and percent employment decrease causing a negative impact upon the revenue picture.

Figure 58. CSA-17, Victories Casino, Emmet, Percent of Population Employed Summary

CSA 17 - The percent of population employed had a cumulative -23% change after the CSA introduction. This large CSA saw population increase and percent employment decrease. The revenue picture would be declining.

Summary of Percent of Population Employed Data

The revenue picture is a combination of population growth and percentage of population employed. In the observed cases a change was noted in 60% of the CSAs viewed. In only six of the 17 casino venues did the revenue picture improve during the period coinciding with the opening of a casino. Seven of the 17 casinos saw the revenue picture decrease. The remaining four casino locations had no change in the revenue picture. Clearly there is nothing here to support the notion that a new casino can be expected to bring a more positive employment picture.

Data for SEV - Commercial

SEV commercial is one way of comparing economic well being between communities. Property value measurements are problematic. Variance in local tax legislation makes comparing tax revenue a somewhat obscure measure. Revenue based on sales tax or adjusted gross revenues are not consistent between venues. SEV is the cleanest available measure of economic activity within a community. Sales will work in some markets but do not generally link well to the local economy; products may be sold to consumers in other communities and benefit stock holders in other communities.

111

This section of the data analysis will look at the difference between CSA SEV (commercial) cumulative changes during the three years before and CSA SEV (commercial) cumulative changes during the three years after the introduction of a casino into the community.

Figure 59. CSA-01, Bay Mills Casino, Grand Traverse, SEV - Commercial Summary

CSA 01 - SEV data was not available for the period preceding the opening of the casino.

Figure 60. CSA-02, Leelanau Sands Casino, Leelanau, SEV -Commercial Summary

CSA 02 - SEV data was not available for the period preceding the opening of the casino.

Figure 61. CSA-03, Kewadin Vegas Casino, Mackinac, SEV -Commercial Summary

Figure 73. CSA-15, Soaring Eagle Casino, Isabella, SEV -Commercial Summary

CSA 15 - SEV (commercial) value had a cumulative +30% change after the CSA introduction than before the introduction.

Figure 74. CSA-16, Little River Casino, Manistee, SEV -Commercial Summary

CSA 16 - SEV (commercial) value had a cumulative +19% change after the CSA introduction than before the introduction.

Figure 75. CSA-17, Victories Casino, Emmet, SEV -Commercial Summary

CSA 17 - SEV (Commercial) value had a cumulative +5% change after the CSA introduction than before the introduction.

Data for SEV - Residential

State Equalized Value (residential) is one way of comparing economic well-being between communities. Property values are very difficult to measure. SEV for residential properties is a good proxy measure of economic activity within a community.

This section of the data analysis will look at the difference between CSA SEV (residential) cumulative changes during the three years before and CSA SEV (residential) cumulative changes during the three years after the introduction of a casino into the community.

Figure 76. CSA-01, Bay Mills Casino, Grand Traverse, SEV - Residential

CSA 01 - SEV data was not available for the period preceding the opening of the casino.

Figure 77. CSA-02, Leelanau Sands Casino, Leelanau, SEV -Residential Summary

CSA 02 - SEV data was not available for the period preceding the opening of the casino.

CSA 07 - SEV data was not available for the period preceding the opening of the casino.

Figure 83. CSA-08, Brimley Kings Casino, Chippewa, SEV -Residential Summary

CSA 08 - The SEV (residential) value had a cumulative +17% change after the CSA introduction than before the introduction.

Figure 84. CSA-09, Chip-In Island Casino, Menominee, SEV -Residential Summary

CSA 09 - The SEV (residential) value had a cumulative +18% change after the CSA introduction than before the introduction.

Figure 85. CSA-10, Kewadin Slots Casino, Alger, SEV -Residential Summary

CSA 10 - The SEV (residential) value had a cumulative +10% change after the CSA introduction than before the introduction.

Figure 86. CSA-11, Kewadin Slots Casino, Mackinac, SEV -Residential Summary

CSA 11 - The SEV(residential) value had a cumulative -17% change after the CSA introduction than before the introduction.

Figure 87. CSA-12, Kewadin Slots Casino, Schoolcratt, SEV - Residential Summary

CSA 12 - The SEV (residential) value had a cumulative +26% change after the CSA introduction than before the introduction.

Figure 88. CSA-13, Ojibwa Casino, Marquette, SEV -Residential Summary

CSA 13 - The SEV (residential) value had a cumulative +2% change after the CSA introduction than before the introduction.

Figure 89. CSA-14, Turtle Creek Casino, Grand Traverse, SEV - Residential Summary

CSA 14 - The SEV (residential) value had a cumulative -9% change after the CSA introduction than before the introduction.

Figure 90. CSA-15, Soaring Eagle Casino, Isabella, SEV -Residential Summary

CSA 15 - The SEV (residential) value had a cumulative +7% change after the CSA introduction than before the introduction.

Figure 91. CSA-16, Little River Casino, Manistee, SEV -Residential Summary

CSA 16 - The SEV (residential) value had a cumulative -2% change after the CSA introduction than before the introduction.

Figure 92. CSA-17, Victories Casino, Emmet, SEV -Residential Summary

CSA 17 - The SEV (residential) value had a cumulative +14% change after the CSA introduction than before the introduction.

Data for SEV - Commercial/Industrial/Residential

SEV - (commercial/industrial/residential) is one way of comparing economic well-being between communities. Tax legislation makes comparing tax revenue a somewhat obscure measure. SEV for combined commercial, industrial, and residential properties provides a useful metric for overall community economic well-being.

This section of the data analysis will look at the difference between CSA SEV (commercial/industrial/residential cumulative changes before during the three years and CSA SEV (commercial/industrial/residential) cumulative changes during the three years after the introduction of a casino into the community.

SUMMARY, CONCLUSIONS, AND IMPLICATIONS

Summary

Literature Comparisons

The literature sources previously cited point to employment Evans and Topoleski, (2002); Felsentstein, et. al., (1999); Grinols, (1995); Alexander, (2002); and the National Indian Gaming Commission, (1999), number of Alexander, Grinols, (1995);and businesses, (2002)business revenue, Blevins and Jensen, (1998); Gazel, et. al., (2000); Grinols, (1995); Goodman, (1994); and recreational and non-recreational industry activities, Przybylski and Littlepage, (1997); Nickerson, (1995); and Goodman, (1995), per capita income, Cornell, et. al., (1998); household income, Phares (2001) and property values, Eadington, (1993); Tiebout, (1975); and Schumpeter, (1993) as significant indicators for economic impact research. The rural perspective and construction of this study limited access to some characteristic variables cited by other authors for population, Kleine, et. al., (2002); employment, Taylor, (2005); and Adams, (2004), Murphey, (1997); and Kettle, (2003), property, Greenblatt, (2003); Rose, (1998); Fulton, (2006);

Anderson, (1997); and Kleine, et. al., (2002). An effort was made to locate usable data that would closely approximate these accepted values as in Berquist, (1995).

Employment is drawn from a labor perspective using population data, labor force, and percent of population employed.

Business economic activity was approximated using the SEV for commercial, industrial, residential, and commercial/industrial/residential property combined as a substitute measure for dollars funneled into or funneled out of the geographical definition of the community over time. The study spans a 20-year tracking period and considerable volume of data. This amount to a selected short-term longitudinal data was over assessments, such as sales tax or adjusted gross revenues seen in many popular studies, Moore, (1993); U.S. General Accounting Office, (2000); Eadington, (1993); and Kleine, et. al., (2002).

These values come very close to approximating the nature of measurement of these economic forecasters using in the available literature on the subject.

Significance of the CSA Approach

For the purposes of this study, the use of a CSA was a necessary strategy. Economic impact is easiest to isolate in the area within some physical distance from the casino. Customers need to travel to the casino to

consume the product. Casinos are not consistently located in the physical center of a county and are not necessarily the driving economic force in a county. This combination of factors means the use of county level data is not adequate to identify the economic contribution of a casino.

The U. S. Census Bureau has long used the MSA as a way to understand economic health of a community. This does fit with existing geopolitical premise not boundaries and characteristics related to casinos. A worker might live and spend most of his or her income in a county different from where he or she works. However, of the population and economic data is most only available at the county level. An MSA is a compromise; it considers a county as a core unit in the MSA but adds adjacent counties that meet criteria for shared economic activity. The group of counties is then considered as a combined economic market.

The CSA is a construct created for this investigation. Its application closely parallels that of an MSA. The core unit level is a township. Since the business activity of interest here is a casino, and the market is those customers who travel to the casino; adjacent townships are added based on their physical distance from the casino. This was done by drawing a circle with a 15 mile radius with its center at the

casino. All townships with at least 50% of their land area within the circle are included in the CSA. Fifteen miles was chosen as the radius because it yields a land area similar in size of an average Michigan county.

A further adjustment was made based on variations in the WTD. Some parts of the state seem to have citizens more or less willing to drive long distances. All the rural casinos in Michigan were considered using a CSA based on a 15-mile radius and an additional adapted radius based on apparent willingness to drive.

Geography, Substitution, and Import/Export

One of the most complex confounding factors is that of nationality. Indian tribal groups operate all of the rural casinos in Michigan. As such, they are sovereign nations. When considering economic good, it is critical to understand the position of the person seeking the answer.

The sovereign nation status of tribal lands means the commercial transaction is between nations. A state public administrator has little or no valid interest. Sovereign Nation means outside the control of the politicians. However, in reality, the threats of obstruction, delay, and bad public relations have driven tribal officials to negotiate some revenue sharing.

A commercial transaction is easily classified into import, export, substitution, or other. In fact, all commercial transactions are all four. If something is an import for one entity, it is an export for another. All purchases are the result of a choice between possible uses for the money and are therefore substitutions. All transactions are "other." That is to say, they are all of no interest to someone.

To clarify the nature of the commercial transaction, who wants the answer needs to be determined. Α transaction between two cities within Michigan is an import/export to a local public administrator, but it is substitution to a state public official. То а an administrator in a third city, it may be a lamentable loss of revenue, but it easily falls into the other category.

Casino gambling in rural areas is bringing money into a foreign nation and sending it out of the state. It is therefore, an export for the tribes and an import for the state. Imports are bad for local casino operations; exports are good. A significant imbalance is certainly a negative.

Viewed from a different, and perhaps slightly more reality based position, gambling is considered a substitution for the state. It is money spent on one activity as opposed to another, both within the state.

Data Summary

A review of the summary data shows some clear patterns. Tables 3 and 4 show the sum of the percent changes for three years after the introduction of a casino minus the sum of the percent changes for the three years prior to the introduction of a casino. This is not an aggregate value, but the sum of the three changes.

Population - Only nine of the 17 casinos showed more population increase after the casino opening than before. Even fewer showed what might be called significant increases.

Employment (labor force): While which casinos scored better or worse depends on population, the general summary about population is the same. Only about half of the CSAs showed increases in the labor force.

Employment (share of the population employed): The scores are rearranged from those for either population or labor force, but the summary is the same.

SEV: This data set only goes back to 1985. Eight of the earlier casinos did not have SEV data available for the three years prior to opening. SEV values for the other casinos showed increases for about three-quarters of the casinos. This is not comforting information. If the population does not go up the labor force does not increase, and the share of the population employed does not increase but the SEV goes up, this is not comforting for the local economy. Certainly, a local public administrator would have to think carefully about the economic benefits of a new casino if the only change was an increase in taxes without an increase in jobs.

It is worthy of note that five of the eight oldest casinos showed both significant increases in labor force and share of population employed after casinos opened in the area. These early casinos tend to be in rural areas and it would certainly be positive if the employment environment improved in those areas. Soaring Eagle Casino (CSA 15) was the only clear win. In all categories studied, the economic picture of the community improved after the casino opened. No attempt is made here to explain why one casino may have brought economic progress to its surrounding community while theirs had little impact.

Table 5 shows a comparison of the results for standard and adjusted CSA areas. About half of the casinos studied had more impact on the adjusted area than on the standard area. The apparent WTD difference between communities seems to have no impact on the evaluation of CSAs.

Limitations

This inquiry was limited by the lack of uniform data sources and reporting criteria between the individual CSA ideal gaming venues studied. An environment would future cost-benefit analysis to anticipate support decision making and set policy and procedure to extract and archive this information for this analysis in the future. The effort would have been greatly enhanced if policy makers had crafted operating compact language to significantly standardize gaming agreements with this future need in mind.

Future Research

One of the repeating factors and most intangible issue that surfaced during this study was the presence of social and opportunity costs. Further, there was a limit of quantitative mechanisms in which to measure their economic impacts. The literature reflects many opinions when identifying a means by which it is studied. Much of the research is focused on this factor as an outcome in gaming development. Future research at the same unit level could be enhanced by quantifying this factor and subsequently applying it to the CSA methodology once agreement was reached on how to quantify it. Another statewide system of casinos could be used for the basis of an inquiry using this methodology developed here. This may further validate the results obtained here using the CSA methodology. The results could also be further tested using rural commercial gaming venues at the core of the CSA.

Modifying the study to look at the distribution of net profits or revenues generated by individual casino operations the surrounding community could enhance the short-term impact perspective of the operation.

Three stratifications of the data appeared in the results obtained from the rural sites. Small, medium and large communities could be isolated further to determine whether the economic activity of the area was significant in determining the outcome of the economic output generated by a specific casino site. This would entail identification of all the economic engines within a CSA and tracking their contribution to the variables observed in this study.

Contributions

There are several processes developed and used in this investigation that have contributed to future public administration research for rural communities and other government venues. For Michigan specifically, and rural

communities in general, the use of the CSA construct provides an additional tool to analyze economic data for future public decision making. The smaller township unit structure of the CSA allows for applications in geographical areas that previously did not have means to analyze economic factors affecting these communities.

The collection, processing, and organization of the raw township level data used in this study has already contributed to other contemporaneous research for Michigan researchers. The database constructed provides data for small governmental agencies across the entire state.

Conclusions

There is no significant expectation of positive, negative, or neutral change in the population, labor force, percentage of population employed, or any of the SEV factors observed. If community leaders are offered a casino, they will need to evaluate the proposal carefully. The often forecast economic benefits for communities seems to only appear in approximately half the cases. This is certainly not, on its face, a good bet.

Anti-gamers can point to the absence of a direct correlation between casino introduction and economic prosperity for a community.

Gaming proponents, particularly those who have relied on gaming industry research to demonstrate a direct link, between introducing a casino and economic prosperity will have trouble proving this relationship. Much of the research for the specific communities studied here did not have access to data of this nature or level prior to this study.

Any proposal that will cost the community must be linked to some means of recovering costs. If a new casino will increase costs for public safety staffing or equipment, the proposal will need to show how that cost will be recovered. The promise of future economic growth is not enough to justify up-front expenditures, such as infrastructure.

Casinos can be profitable, but whether they are a positive addition to a community cannot be evaluated based solely on their positive economic impact. Without a clear positive change in the local economy, the challenge of showing a causal relationship between economic impact and the introduction of a casino becomes mute.

Implications

Community leaders considering the introduction of casinos into their rural communities should not expect any changes in population, labor market, or property values to be directly attributable to the casino. It is possible the casino will have a positive economic impact on the surrounding community. However, it cannot be expected. Betting in the casino may have better odds than betting on the casino. Human Subjects Institutional Review Board Approval Letter

HSIRB APPROVAL LETTER

Human Subjects Institutional Review Board

Date: May 16, 2005

To: Robert Peters, Principal Investigator Mark Recee, Student Investigator for dissertation

From: Mary Lagerwey, Ph.D., Chair

Re: Approval not needed

This letter will serve as confirmation that your project "Economic Impact of Indian Casino Gaming upon Michigan Communities" has been reviewed by the Human Subjects Institutional Review Board (HSIRB). Based on that review, the HSIRB has determined that approval is not required for you to conduct this project because you will use only publicly available secondary data. Thank you for your concerns about protecting the rights and welfare of human subjects.

A copy of your protocol and a copy of this letter will be maintained in the HSIRB files.

Walwood Hall, Kałamazoo, MJ 49008-5456 PHONE: (269) 387-8293 FAX: (269) 387-8275 Appendix B

Glossary

Glossary

- Assessed value (AV) -- Assessed value is half the true cash value of a property as determined by the assessor.
- Community Neighborhood, vicinity, synonymous with locality. A society or body of people living in the same place, under the same laws and regulations and have common rights, privileges, or interests together. It connotes a congeries of common interests arising from associations: social, business, religious, governmental, scholastic, and recreational.
- Community Impact The effect or impression of one factor upon a community. The verbal use of impact is caused by its derivation from an already questionable metaphoric use of the noun impact, as in phrases such as the political impact of the decision or the impact of the program on the community, in which no more is usually meant than might have been expressed by effects or consequences.
- Compact A negotiated agreement or contract between people, nations, or states. The term is commonly applied to working agreements between and among states concerning matters of mutual concern. A contract between parties, which creates obligations and rights capable of being enforced and contemplated as such between the parties, in their distinct and independent characters.
- Consent Decree Agreement by defendant to cease activities asserted as illegal by government. Upon approval of such agreement by the court the government's action against the defendant is dropped. A decree is also entered in an equity suit on consent of both parties. It is not a judicial sentence but is in the nature of a solemn contract or agreement of the parties, made under the sanction of the court, and in effect an admission by them that the decree is a just determination of their rights upon the real facts of the case, if such facts had been proved. It binds only the consenting parties and is not binding upon the court.

Independent Sovereign - The basic distinction that sets Indian communities apart from other groups of people in the United States as self-governing peoples, whose nationhood preceded that of the United States. As nations, they signed treaties with the U.S. government and continue to function as separate governments within the federal framework.

The United States has long acknowledged a special "government-to-government" relationship with the recognized Indian groups and with the Alaskan Native Villages. Also, the United States government is deemed to have a trust relationship with Indian people that assumed contractual and statutory responsibilities to protect remaining Native-American lands and to promote the health, welfare, and education of Indians and Native Americans.

- Indian A person having origins in any of the original peoples of North and South America (including Central America) and who maintain tribal affiliation or community attachment (U.S. Census Bureau, 2000)
- Indian Gaming Regulatory Act The Indian Gaming Regulatory Act, enacted in 1988 as Public law 100-497 and now codified at 25 U.S.C.*2701, establishes the federal jurisdictional framework that presently governs Indian gaming. The act establishes three classes of games with a different regulatory scheme for each. Class I gaming is defined as traditional Indian gaming and social gaming for minimal prizes. Regulatory authority over

Class I Gaming - is vested exclusively in tribal governments.

Class II Gaming - defined as the game of chance commonly known as bingo (whether or not electronic, computer, or other technological aids are used in connection therewith) and if played in the same location as the bingo, pull tabs, punch board, tip jars, instant bingo, and other games similar to bingo. Class II gaming also includes non-banked card games, that is, games that are played exclusively against other players rather than against the house or a player acting as a bank. The act specifically excludes slot machines or electronic facsimiles of any game of chance from the definition of Class II games. Tribes retain their authority to conduct, license, and regulate Class II gaming so long as the state in which the Tribe is located permits such gaming for the purpose and the Tribal government adopts a gaming ordinance approved by the Commission, Tribal governments are responsible for regulating class II gaming with Commission oversight.

Class III Gaming - extremely broad classification gaming types. It includes all forms of gaming that are neither Class I nor II. Games commonly played at casinos, such as slot machines, black jack, craps, and roulette, would clearly fall in the Class III category, as well as wagering games and electronic facsimiles of any game of chance. Generally, class III is often referred to a casino-style gaming. As a compromise, the Act restricts tribal authority to conduct Class III gaming.

Before a Tribe may lawfully conduct Class III gaming, the following conditions must be met: (1) The particular form of Class III gaming that the tribe wants to conduct must be permitted in the state in which the tribe is located; (2) The tribe and the state must have negotiated a compact that has been approved by the Secretary of the Interior, or the Secretary must have approved regulatory procedures, and (3) The tribe must have adopted a tribal gaming ordinance that has been approved by the chairman of the commission.

The regulatory scheme for Class III gaming is more complex than a casual reading of the statute might suggest. Although Congress clearly intended regulatory issues to be addressed in tribal state gaming compacts, it left a number key function in federal hands, including approval authority over compacts, management contracts, and tribal gaming ordinances. Congress also vested the commission with broad authority to issue regulations in furtherance of the purposes of the act. Accordingly the commission plays a key role in the regulation of class II and class III gaming (NIGC, 2004).

- Indian Lands Real property ceded to the United States by Indians, commonly to be held in trust for Indians.
- Indian Reservation A part of public domain set aside by proper authority for use and occupation of tribe or tribes of Indians.
- Indian tribal property Described as property where an Indian tribe has a legally enforceable interest. Such term refers to real property, the title to which is

vested in United States but held in trust for the Indian tribe. Such property, depending on context in which the term is used, may or may not be "public property" of the United States.

- Indian Tribe A separate and distinct community or body of the aboriginal Indian race of people found in the United States. An "Indian tribe" within meaning of Indian Non-intercourse Act is a body of Indians of the same or similar race, united in a community under one leadership or government, and inhabiting a particular, though sometimes ill-defined, territory.
- Member One of the persons constituting a family, partnership, association, corporation, guild, court, legislature, or the like.
- Native American A member of any of the aboriginal peoples found in the Western Hemisphere. The ancestors of the Native Americans are generally considered to have entered the Americas from Asia by way of the Bering Strait sometime during the late glacial epoch. Native American and Indian are not exact equivalents when referring to the aboriginal peoples of Canada and Alaska. Native American, the broader term, is properly used of all such peoples, whereas Indian is customarily used of the northern Athabaskan and Algonquian peoples in contrast to the Eskimo and Aleut.
- Parsimonious Adoption of the simplest assumption in the formulation of a theory or in the interpretation of data, especially in accordance with the Ockham's Razor.
- Population Density People per square mile of land (U.S. Census Bureau, 2000)
- Proposal A A proposal to increase the state sales and use tax rates from 4% to 6%, limit annual increases in property tax assessments, exempt school operating millages from uniform taxation requirement and require 3/4 vote of Legislature to exceed statutorily established school operating millage rates. The proposed constitutional amendment would:
 - Limit annual assessment increase for each property parcel to 5% or inflation rate, whichever is less. When property is sold or transferred, adjust assessment to current value.

- 2. Increase the sales/use tax. Dedicate additional revenue to schools.
- 3. Exempt school operating millages from uniform taxation requirement.
- 4. Require 3/4 vote of legislature to exceed school operating millage rates.
- 5. Activate laws raising additional school revenues through taxation including partial restoration of property tax.
- 6. Nullify alternative laws raising school revenues through taxation, including an increase income tax, personal exemption increase, and partial restoration of property taxes.

Should this proposal be adopted? Yes ___ No____

- Proposal A amended Title IX (Finance and Taxation) of the Michigan Constitution, Sections 3, 5, and 8. Adopted March 15, 1994
- Proposal E A citizen's initiative to allow non-Indian casino gaming in Michigan, was approved by Michigan voters in a statewide general election on November 5, 1996. It was later significantly strengthened and improved with the passage of Public Act 69 of 1997.

An act providing for the licensing and control of casino gambling operations, manufacturers and distributors of gaming devices and gaming employees; providing for the distribution of revenue for public education, public safety and economic development; authorizing limited casino operations within the State of Michigan; and vesting authority for the regulation of casino gaming in a gaming control board.

Ballot Language:

A Legislative Initiative to Permit Casino Gaming in Qualified Cities

The proposed law would make the following provisions: permit up to three gaming casinos in any city that meets the following qualifications: has a population of 800,000 or more, is located within 100 miles of any other state or country in which gaming is permitted, and has had casino gaming approved by a majority of the voters in the city.

Establish a Gaming Control Board to regulate casino gaming.

Impose an 18% state tax on gross gaming revenues.

Allocate 55% of tax revenue to the host city for crime prevention and economic development; allocate remaining 45% of tax funds to the state for public education.

Should the proposed law be adopted?

Yes [_] No [_]

Results: 1,878,542 Yes (51.5%) vs. 1,768,156 No (48.5%) (Copyright * 2003 State of Michigan)

- Ockham's Razor A rule in science and philosophy stating that entities should not be multiplied needlessly. This rule is interpreted to mean that the simplest of two or more competing theories is preferable and that an explanation for unknown phenomena should first be attempted in terms of what is already known. Also know as Law of Parsimony. (Copyright * 2006 American Heritage Dictionary/Dictionary.com)
- Ockham, William of (1285-1349) English scholastic philosopher who rejected the reality of universal concepts and argued that mental and linguistic signs are the only genuinely universal features of reality.
- Riverboat Casino A riverboat casino is a type of casino unique to several areas of the United States which use a riverboat as a casino. A riverboat is a water vessel designed for river navigation. When first approved, these casinos were required to actually be located on vessels that could sail away from the dock. In some areas, gambling was only allowed when the ship was sailing. Over time, these regulations allowed gambling when the vessel was docked. In some states, such as Indiana, the boats are no longer required to leave dock or even have a captain and crew on board while the casino is open. Further changes allowed these casinos to be located in a moat or an area with water adjacent to a navigable waterway. Over time, these casinos were allowed to be built on stilts but still had to be over water.

(Copyright * 2006 American Heritage Dictionary/Dictionary.com)

- Social Costs used to describe opportunity cost to the community at large.
- State Equalized Value SEV is the assessed value as finalized by the county and state equalization processes. A process of equalization of assessments has been established in Michigan to meet the constitutional mandate that all property be uniformly assessed. Michigan Compiled Law 211.34 (Section 34 of Michigan's General Property Tax Act) covers the process of county equalization. This section of the law requires the County Board of Commissioners to examine the assessment rolls of the cities and townships within the county each year and determine whether each class of real and personal property in each city and township has been equally and uniformly assessed at a level of 50 percent of true cash value. If necessary, the County Board of Commissioners must add to or deduct from the value of a class of property within a city or township so that the total value of that class of property is set at 50 percent of the class's true cash value. In most units of government, the assessed value and the State equalized value will be the same
- Sunset Law/Language Statute which requires administrative bodies to justify periodically their existence to legislature.
- Taxable value (TV) Taxable Value is the amount on which property taxes are paid. A parcel's taxable value multiplied by the appropriate millage rate for that parcel yields the yearly property tax amount for that parcel. In most cases, taxable value is simply the lesser of the State Equalized Value and the capped value for the year in question.
- Tribal Council Each village is governed by councils; councils usually consist of representatives from each family, or made up of representatives from the village population. The council elects a person to act as chief or chairperson to preside over the council and act as principal liaison in dealing with other groups.

Tribal Community - see Community.

Tribe - see Indian Tribe

- Tribal-State Compact is a negotiated contract between an Indian Tribal Council and a state regarding the operating parameters and financial obligations for conducting gaming activities in that State. Tribal-State Gaming Compacts are written agreements between the tribal communities and the State, which are signed by the Governor. There are currently 11 State-Tribal Compacts signed in 1993 & 1998.
- Michigan Gaming Control Board (MGCB) state department with staff oversight responsibility for the State's Native American casinos. This responsibility, originally assigned to the Michigan Department of Agriculture's Office of Racing Commissioner, was effectively transferred to the MGCB staff in June 1996 (the five-member Board has no involvement with tribal casinos).

Oversight responsibility by MGCB staff is limited to the following tasks:

Inspecting tribal facilities and documents to assure compliance with Tribal-State Gaming Compacts and related agreements.

Examining casino's electronic games of chance (slot machines, video poker, etc.) to assure that devices are operating in accordance with terms of Compacts.

Conducting financial audits to assure that tribes are paying to the State 8% of Net Win derived from electronic games of chance, and 2% to local municipalities, in accordance with August 1993 Consent Judgment & 1993 Tribal State Gaming Compacts.

Note - "Net Win" (sometimes referred to as "Adjusted Gross Receipts") is a casino's gross receipts, less winnings paid to wagerers (Copyright* 2003 State of Michigan). Also, See Bibliography. Appendix C

Casino Statistical Area Construction

APPENDIX T

Casino Statistical Area Construction

Casino Statistical Areas (CSA's) were created along the same lines as the U.S. Census Bureau's Metropolitan Statistical Areas (MSA). The goal was to create a study area of approximately the same size as a typical Michigan county. While an MSA is centered on a metropolitan area, the CSA is centered on a casino. MSA's include or exclude adjacent counties based on the share of economic activity drawn from the core county. CSA's include or exclude adjacent townships based on the share of the township land area included in a circle centered on the casino. This approach was used to evaluate the degree of economic impact of the casino on the surrounding community.

Two circle radii were used. A standard radius of fifteen miles and an adjusted radius based on the area's relative willingness to drive. The standard radius encompasses a land area similar to that of a Michigan county. The adjusted radius was developed from Census data on the number of minutes people drive to work, also referred to as drive time to work. If people in one area are used to driving further to work than those in another area, it may be they will be willing to drive further for

other activities, such as recreation as well. So, an alternate CSA perimeter was considered with a radius adjusted to reflect the areas relative willingness to drive. It is not assumed they will drive further, both CSA constructs were evaluated to determine whether different assumptions about drive times might produce different conclusions about economic impact on the community surrounding the casino.

Figure 211 is used to display Michigan county size approximating the calculation of area used in establishing the standard CSA radius.

The following tables show the results of the calculations for willingness to drive.

Casino Statistical Area Maps

APPENDIX U

Casino Statistical Area Maps

Casino Statistical Areas (CSA's) were created along the same lines as the U.S. Census Bureau's Metropolitan Statistical Areas (MSA). The goal was to create a study area of approximately the same size as a typical Michigan county. While an MSA is centered on a metropolitan area, the CSA is centered on a casino. MSA's include or exclude adjacent counties based on the share of economic activity drawn from the core county. CSA's include or exclude adjacent townships based on the share of the township land area included in a circle centered on the casino. Township units were used because this is the smallest unit for which economic data is available in rural areas. This approach was used to evaluate the degree of economic impact of the casino on the surrounding community.

Two circle radii were used. A standard radius of fifteen miles and an adjusted radius based on the area's relative willingness to drive. The standard radius encompasses a land area similar to that of a Michigan county. The adjusted radius was based on Census data on the number of minutes people drive to work. If people in one area are used to driving further to work than those

in another area, it may be they will be willing to drive further for other activities as well. So, an alternate CSA perimeter was considered with a radius adjusted to reflect the areas relative willingness to drive. It is not assumed they will drive further, both CSA constructs were evaluated to determine whether different assumptions about drive times might produce different conclusions about economic impact on the community surrounding the casino.

The following maps show which townships were included and excluded from each CSA, both for the standard and adjusted CSA perimeter values.

APPENDIX V

Computer Software Used

Basic data aggregation and charting was done with Microsoft[®] Excel[®] from Office 2002 [™]. More sophisticated software might be used, but its value would be questionable. This work was done to evaluate economic impact of the introduction of a casino. Looking at the three years prior to the opening of the casino and comparing that data to data from the three years after the opening provides an indication of the impact of the economic event for each analysis factor. The data is only available in annual summary format. Two problems arise in selection of software. First, three data points is not enough to establish a useful trend line, therefore sophisticated analysis is not possible. Second, if the change is so subtle that sophisticated analysis is necessary, the results are of little use to the local public administrator. Their practical concern would impinge more on the trend information over statistical significance beyond a percentage point. A tenth of a percent change in labor market values over the course of a year is insufficient to provide decision support of a township commissioner. Academically, it would be

551

interesting, from a public administration standpoint, it is not.
